

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	Our company's network went down for 2 hours. Cause: a DoS attack using an ICMP flood (ping flood). The attacker got in through an unconfigured firewall. Impact: internal traffic couldn't reach network resources. Response: we blocked incoming ICMP, took non-critical services offline, and restored critical services
Identify	Attack type: DoS, specifically an ICMP flood. Affected systems: firewall, internal network, and all network services. Root cause: the firewall had no rules limiting ICMP traffic. Action: audit all firewalls, devices, and access privileges regularly.
Protect	Add a firewall rule to limit the rate of incoming ICMP packets. Turn on source IP verification to catch spoofed addresses. Review firewall configs on a regular schedule. Train staff on basic security and incident reporting.
Detect	Install network monitoring software to spot abnormal traffic. Use an IDS/IPS to flag and filter suspicious ICMP traffic. Set alerts for traffic spikes from untrusted IPs. Log and review firewall activity.

Respond	Contain: block the attacking traffic and isolate affected systems. Neutralize: take non-critical services offline so critical ones stay up. Analyze: use firewall logs, IDS/IPS alerts, and traffic captures. Report the incident to management and stakeholders. After the incident, review what worked and update the process
Recover	Restore critical services first, then non-critical ones. Block external ICMP flood traffic at the firewall. Confirm the network is back to normal before bringing everything online. Keep good backups so recovery is faster next time. Do a lessons-learned review and update the response plan.
